SUMMARY

There were five reported site visits in the past seven days, with five samples collected. Algal bloom conditions were not observed by samplers at any of the sites.

On 11/22, South Florida Water Management District staff collected a sample near the S77 structure on the C43 Canal. There was no dominant algal taxon and a trace level of microcystins (0.34 parts per billion [ppb]) was detected.

On 11/22, St. Johns River Water Management District (SJRWMD) staff collected samples at four routine HAB monitoring stations. The Lake Jesup sample had a dominant algal taxon, *Cylindrospermopsis raciborskii*, and a trace level of cylindrospermopsin (0.15 ppb) was detected. The Blue Cypress Lake sample was dominated by *Microcystis aeruginosa* and no cyanotoxins were detected. There was no dominant algal taxon or cyanotoxins detected in the other two samples.

Last week

Results were pending for samples collected by SJRWMD staff on 11/17-18 at four sites. Three samples from Crescent Lake were dominated by *Microcystis aeruginosa*. The *Crescent Lake - South Shore near Hopkins Point* and *Crescent Lake - Sunrise Park Boat* samples had 5.4 ppb and trace level (0.13 ppb) microcystins detected, respectively. There was no dominant algal taxon or cyanotoxins detected in the Lake Washington sample.

Results were pending for samples collected on 11/18 at four sites by Florida Department of Environmental Protection staff. No dominant algal taxon or cyanotoxins were detected.

Results for completed analyses are available and posted at FloridaDEP.gov/AlgalBloom.

This is a high-level summary of the sampling events for the reported week. For all field visit and analytical result details, please refer to the complete algal bloom map with data table by clicking the "Field and Lab Details" Quick Link from the Algal Bloom Dashboard. Different types of blue-green algal bloom species can look different and have different impacts. However, regardless of species, many types of blue-green algae can produce toxins that can make you or your pets sick if swallowed or possibly cause skin and/or eye irritation due to contact. We advise staying out of water where algae is visibly present as specks or mats or where water is discolored pea-green, blue-green or brownish-red. Additionally, pets or livestock should not come into contact with algal bloom-impacted water or with algal bloom material on the shoreline.
