

Florida Shoreline Length Information According to Beaches and Shores Technical and Design Memorandum 89 – 1, 5th Edition, December 1993, entitled *Beach Conditions in Florida: a Statewide Inventory and Identification of the Beach Erosion Problem Areas in Florida* by Ralph R. Clark.

The referenced publication provided most of the following beach length data for Florida’s open coast beaches fronting on the Atlantic Ocean, Straits of Florida and Gulf of Mexico, totaling 825 miles. Not included are interior inlet shorelines and inlet widths between islands, emergent shoals and those areas sheltered by coastal barriers or island shoals. It is recognized that this shoreline length data may fluctuate somewhat due to geomorphological changes; however, in many cases the losses and gains that occur due to island or spit growth or erosion will result in little change overall. Over time, the Florida coast is subject to new inlet breakthroughs and subsequent closures, spit growth, and storm driven erosion losses, making precise beach length data changeable due to significant and cumulative weather events. By county, the latest shoreline length measurements are as follows:
