1. Executive Summary

US Army Corps of Engineers' water-discharges from Lake Okeechobee have historically resulted in the proliferation of toxic cyanobacteria blooms from the Lake into Florida's waterways. These releases have triggered at times, severe bloom conditions both inland as well as onshore - where dead cyanobacteria cells promoted the development of red tides. The potential for undesirable ecological, economic, and health scenarios had to be weighed against the prospects of elevated water levels in the Lake and the risk they posed to its infrastructure.

In October 2020, the State of Florida initiated and executed an innovative emergency effort designed to monitor and treat water discharge from Lake Okeechobee through the C-44 Canal and into the St. Lucie River basin. Spearheaded by Florida's Department of Environmental Protection (*DEP*), together with federal and local state agencies, namely, the St. Johns River Water Management District (*SJRWMD*), the South Florida Water Management District (*SFWMD*), and Florida Fish and Wildlife Conservation Commission (*FWC*), the public-private initiative was put together, approved, and implemented in a few days' time.

The Initiative included a quick-response treatment protocol, designed to reduce toxic cyanobacterial biomass in the water to levels below 20,000 cells/ml before it reaches the St. Lucie Lock & Dam.

As part of Governor DeSantis' Initiative to combat Harmful Agal Blooms (HABs) in the State of Florida, *DEP*, entered into a grant agreement with the St John's River Water Management District; who identified BlueGreen US Water Technologies Inc. (*BlueGreen*) and its *Lake Guard®* technology as uniquely suitable to meet the above objective.

Acting quickly in concert with *SJRWMD*, *SFWMD*, *FWC*, and the U.S. Army Corps of Engineers, *BlueGreen*'s team, equipment and product were deployed and became operational in less than 72 hours from the signed agreement..

The 3-week, 24/7 initiative was concluded once the data generated in the field reassured the state agencies that the risk of a proliferated HAB contamination was low enough to end the operation.

Lessons from this first-of-its-kind initiative are drawn herein to establish a prospective protocol for handling emergencies related to cyanobacterial outbreaks in and around Lake Okeechobee, and in the State of Florida as a whole:

1. A plan modeled after the current initiative and based on insights and lessons learnt thereof.
2. An emergency stockpile for immediate response during future bloom episodes.
3. A general plan for the remediation of Lake Okeechobee against toxic cyanobacterial blooms.

© BlueGreen Water Technologies Ltd

2. Background

The C-44 Canal (St. Lucie Canal) stretches from the eastern bank of Lake Okeechobee. It is designed to discharge water from the lake and the surrounding watershed through the St. Lucie River and estuary (Stuart) and into the Atlantic Ocean (Fig. 1). When water levels in Lake Okeechobee are too high, the U.S. Army Corps of Engineers discharges excess water through the C-44 Canal (Canal) and other outlets to release pressure on infrastructure. The water discharge rate from Lake Okeechobee into the Canal and through the S-80 structure into the St. Lucie River dictates water flow rates in the Canal. During the initiative, pulsed water discharges from the lake peaked at 3,000-4,000 cubic feet per second, or came to a halt, especially earlier in the initiative, to avoid flooding downstream from the Canal due to high tides (Fig. 2).

In late September 2020, *DEP* conducted several risk assessments in response to the U.S. Army Corps of Engineers inclination to opening the flood-gates at the Lake while a toxic algal bloom covered about 40% of the lake's surface area. *DEP*'s concern was that opening the flood-gates would reduce the salinity of the St. Lucie Estuary's waters, and affect its ecological habitat. Furthermore, water release could deteriorate water quality in the entire region if high levels of cyanobacteria were to contaminate Florida's waterways, as was the case in earlier events in 2018 and in 2016.

BlueGreen, which was awarded a project, as part of Governor DeSantis' Initiative to combat HABs, to treat Lake Minneola through an agreement with *SJRWMD*, was asked to put together an urgent operational plan designed to protect the St. Lucie Estuary and prevent an algal bloom outbreak throughout the region.

DEP's call to action included specific deliverables designed for clear understanding of the biological and physiological conditions in the C-44 Canal. Thus, by continuously receiving real-time information, *DEP*

© BlueGreen Water Technologies Ltd

could evaluate the daily condition in the Canal and reach a *Go/No-Go Decision* on treatment based on the most updated and sound scientific grounds.

Fig. 1. (A) Map of the C-44 Canal (St. Lucie Canal) and its surroundings. The water is released from (B) Lake Okeechobee at the S-308 structure (Port Mayaca) and flows east towards the St. Lucie River delta. The green asterisks at the dam represent the sampling points (S-308 Lake-side and S-308 Canal-side). A Silo filled with the *Lake Guard®* Oxy and ready for product deployment was erected at the mouth of the Canal under the U.S. 98 overpass (Red Asterisk). Additional sampling points were established 12 miles downstream at Timer Powers Park, and 21 miles downstream from the S-308 structure, at St. Lucie Lock and Dam (S-80 Structure).

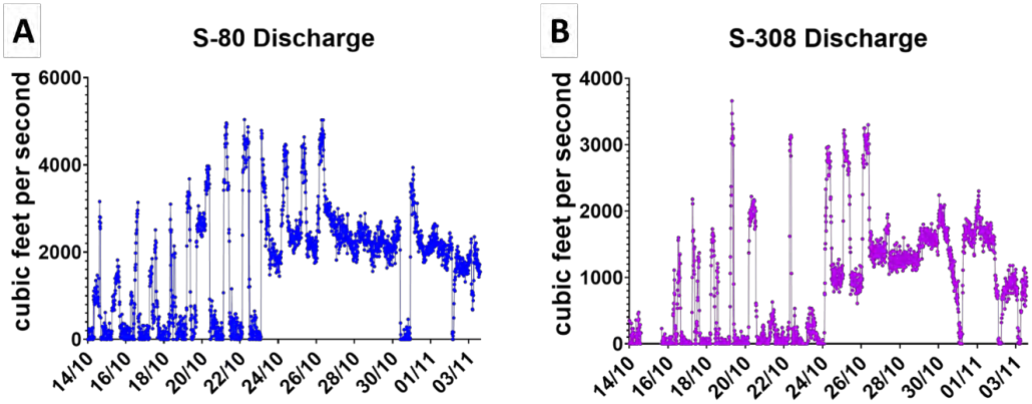

Fig. 2. Water discharge rate at the C-44 Canal during the Initiative. USGS Data 1 and 2.

© BlueGreen Water Technologies Ltd

3. Objectives

The deliverables of the project, as defined by *DEP*, included:

1) Preparedness of *BlueGreen* to deliver an effective treatment in the C-44 Canal within 72 hours
2) 24/7 preparedness of professional crews on site to respond to any discharges of waters with high cyanobacterial biomass from the lake
3) Extensive, ongoing monitoring activities:
    a. 7 days a week, 3 times per day
    b. 3 sampling points along the Canal: S-308 structure (Canal side), Timer Powers Park, and S-80 structure
    c. Parameters included microscopy and *in-situ* digital measurements of pH, dissolved oxygen, temperature, chlorophyll-b, phycocyanin and water conductivity
4) Daily scientific analysis and update on the canal's status
5) Maintaining operational readiness to ensure that cyanobacterial biomass is kept below the harmful levels (as defined by WHO/EPA) of 20,000 cells/ml at the S-80 structure.

4. Performance Summary

4.1. Event Flowchart

Figure 3 summarizes the series of operational events that took place prior to the on-the-ground involvement of *BlueGreen* in the C-44 Initiative. In short, a situational assessment conducted by *DEP* concluded that a risk-mitigation effort was required in order to avoid the possibility of the bloom in Lake Okeechobee from proliferating and spreading into Florida's waterways. *DEP* then defined the objectives of the Initiative and followed by an expedited proposal request issued by phone on Sep 24, 2020. *DEP* coordinated with local agencies, *SJRWMD*, *FWC* and *SFWMD*, and with *BlueGreen* in all legal and regulatory aspects to enable an immediate response as soon as approval is given. This included an

© BlueGreen Water Technologies Ltd

amendment to an existing agreement and filing for an *FWC* permit to allow the use of the *Lake Guard®* Oxy in the C-44 Canal. The approval to begin with the Initiative was given by the *DEP* on October 9, 2020.

Within 48 hours, *BlueGreen* was ready to operate – two days ahead of the intended start date for the water discharge from Lake Okeechobee. The Initiative included partnering with a local licensed and insured applicator (Modica & Associates, Inc.), setting up an operational command post on the north bank of the S-308 structure, and mobilizing product and equipment. During the week of October 12, 2020, all regulatory requirements were fulfilled, including the *FWC* permit to treat the waters in the C-44 Canal with the *Lake Guard®* Oxy.

The 3-week, 24/7 emergency Initiative was concluded once data generated in the field reassured state agencies that the risk of a proliferated HAB contamination was low enough to end the operation.

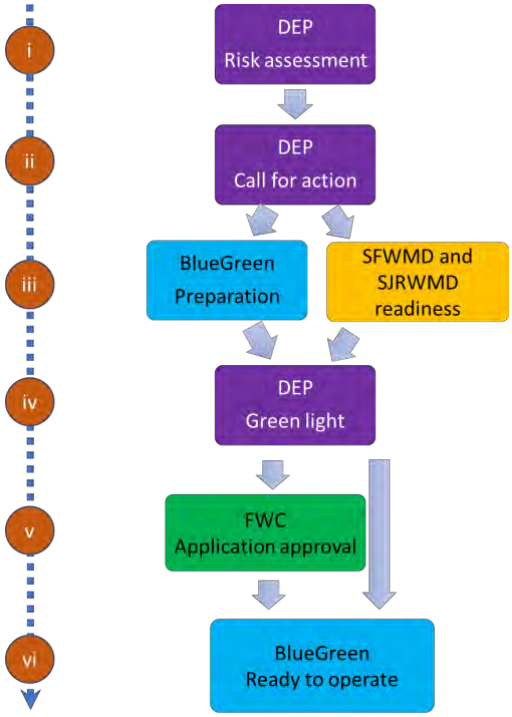

Fig. 3. Event flowchart

4.2. BlueGreen's Post-Hoc Performance

In an effort to fulfill the objectives of this Initiative, *BlueGreen* took on extra measures in addition to *DEP*'s request by initiating additional monitoring activities to reduce uncertainty and to compensate for unknown variables in the field under pressing conditions as detailed below in Table 1.

In order to better understand the dynamics of blooms that could affect the C-44 Canal, *BlueGreen* also performed supplementary research activities around Lake Okeechobee to establish the overall condition in and around the Lake in real-time. This is detailed below in Table 2.

Table 1. DEP pre-defined deliverables vs. actual performances

Due to 508 compliance requirements, Table 1 was removed from this document. To access the full document, which does not meet 508 compliance standards, please reach out to InnTech_HAB@FloridaDEP.gov

© BlueGreen Water Technologies Ltd

Table 2: Additional activities provided by *BlueGreen* during the Initiative

	Item	Description
1	Canal evaluation	A thorough evaluation along the entire Canal was conducted twice during the Initiative.
2	Lake Okeechobee evaluation (satellite)	*BlueGreen* provided its own DAILY satellite imagery analysis (subject to cloud coverage).
3	Lake Okeechobee evaluation (discharge points)	All discharge points were studied within the first 72 hours of the Initiative to establish the overall condition in and around the Lake in real time and to better understand the dynamics of the blooms that could affect the C-44 Canal.
4	Lake Okeechobee evaluation (water surface)	Satellite imagery (NOAA and *BlueGreen*) suggested a HAB formation in the lake, 96 hours after the arrival of the team. *BlueGreen* deployed its scientific team in two helicopters to survey the Lake and collect mid-air water samples – to better understand the dynamics of the blooms that could affect the C-44 Canal.
5	Application Dry run	During the first week of the Initiative, a product application *dry run* was conducted on the Canal side of the S-308 structure to ensure the preparedness and to learn key-lessons regarding the hydrodynamics of the Canal with and without water being discharged from Lake Okeechobee.
6	Final Report	Provided

4.3. Scientific Data Analysis

The methods and results of the three-week Initiative are listed in Appendix B.

Fig. 6 shows *in-situ* digital morning measurements from all four sampling points. Below are our key observations:

It took approximately one week from the day the dam gates in Lake Okeechobee were first opened until the waters from the lake caused a significant decrease in water conductivity ('salinity') levels at the east end of the C-44 Canal, S-80 structure (Figs. 2 and 6B). Phycocyanin levels, a proxy for cyanobacterial biomass, remained low throughout the Initiative (Fig. 6F). This observation was corroborated with microscopic examinations of water samples collected from all sampling points that indicated a cyanobacterial load of ~1,000 cells/ml.

An increase in phycocyanin levels was observed in the S-308 structure, Lake side and Canal side, during the last week of the Initiative (Fig. 6F), albeit, the levels remained low, and not nearing dangerous levels. In consultation with the *DEP* scientists, it was decided not to treat the waters and to continue close monitoring of the waters being discharged from the Lake and throughout the Canal.

© BlueGreen Water Technologies Ltd

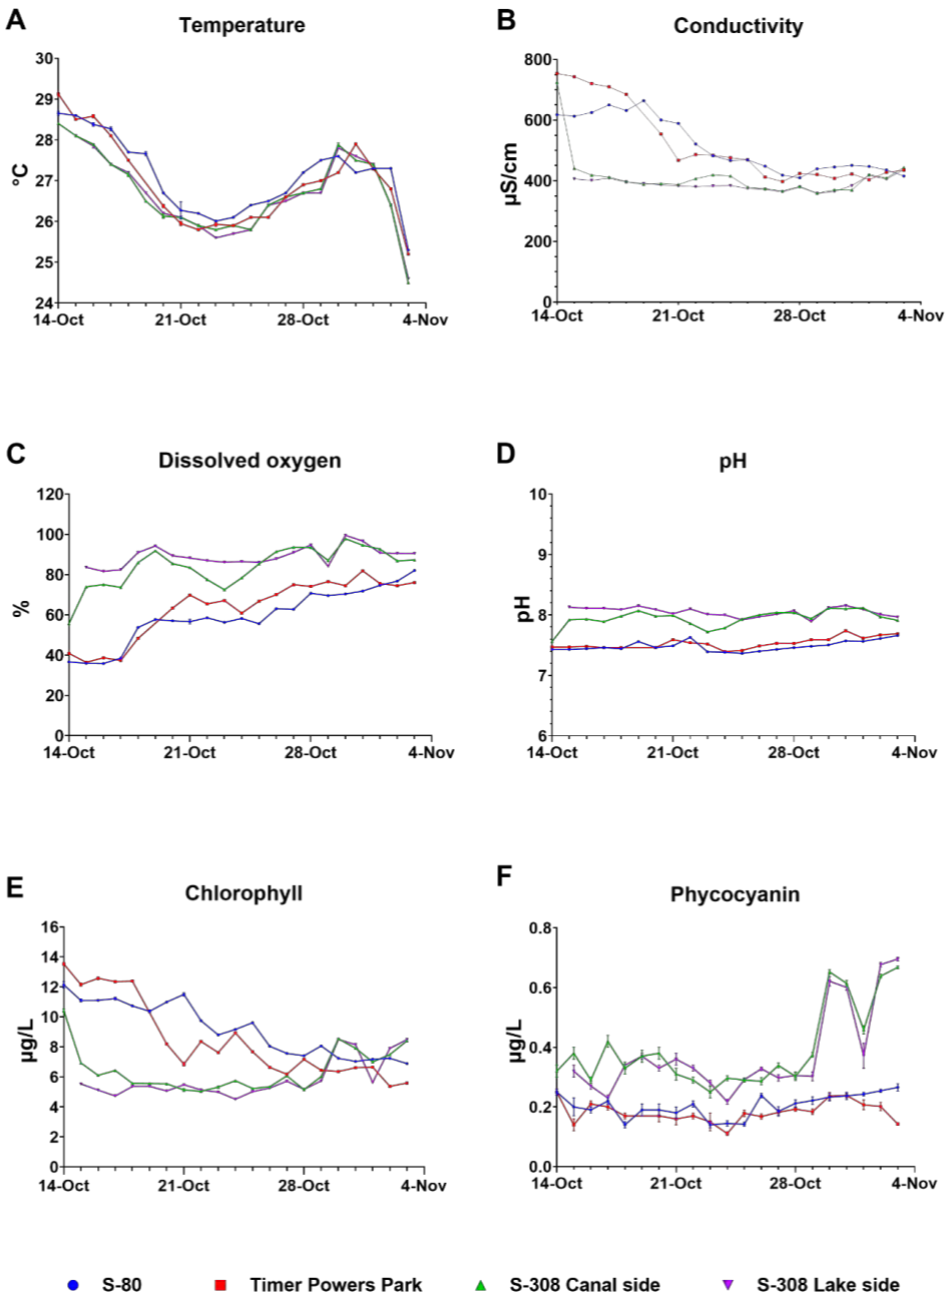

Fig. 6. Morning measurements from the four sampling points, S-308 Lake-side, S-308 Canal side, Timer Powers Park, and S-80. (A) water temperature (C°), (B) Conductivity (µS/cm), (C) dissolved oxygen (%), (D) pH, (E) chlorophyll-b (µg/L, as a proxy for total eukaryotic algae), and (F) phycocyanin levels (µg/L, as a proxy for total cyanobacteria). The values shown are the mean of multiple readings, most standard deviation bars are too small to be visible on the graph.

4.4. Mid-air Sampling in Lake Okeechobee

On October 17, 2020, water samples from Lake Okeechobee were collected mid-air by the *BlueGreen* scientific team, via helicopters. The samples confirmed the presence of mixed cyanobacterial populations of *Microcystis* sp. and *Pseuodoanabaena* sp. in the southern areas of Lake Okeechobee, with cell density at 10^5-10^6 cells/ml (Fig. 7A). Infestation pockets of cyanobacteria could be clearly identified in the southern littoral zones. This raises the possibility that these pockets constitute a main source of cyanobacterial contamination that seed the annual formation of HABs throughout the lake.

Additional inspection of the Lake revealed wind-rows (foam lines) on the western side of the lake, that stretched for tens of miles from south to north (Fig. 7B). Water samples collected near these foam lines included *Planktothrix* sp., at 1,000-10,000 cells/ml. *Planktothrix* sp. is known for its unique elongated cells, that form brownish blooms submerged throughout the uppermost layer of the waterbody that receives sunlight (photic zone). It is possible, and this remains to be experimentally verified, that when *Planktothrix* sp. cells get lysed, their released proteinous content is "whipped" into a foam-like substance, forming '*slicks*' or aggregations of buoyant algae and foam, Ryan *et al*., 2010.

5. C-44 Canal Emergency Initiative: Conclusions and Proposed Action-Items

This operation, initiated, orchestrated, and supervised by *DEP* and local agencies, was the first attempt to proactively prevent toxic bloom formations in a unique setup (21-mile long canal) and its proliferation from a contaminated Lake through the canal and into waterways along the canal's path.

This Chapter is divided to three parts:

1. **Drawing conclusions from the C-44 Canal Initiative:** Preparing for the next emergency
2. **Drawing conclusions from the C-44 Canal Initiative**: Minimizing risk of HAB during future water discharges from Lake Okeechobee
3. **HAB mitigation in Lake Okeechobee**

   An ambitious draft proposal for a complete survey of the lake's condition encompassing marshes, littoral zones and water surface, and a treatment protocol to reset/restore the lake's ecology to the pre-HAB era.

5.1. Drawing conclusions from the C-44 Canal Initiative: Preparing for the next emergency

This Initiative demonstrated the strong commitment of the different State agencies to act forcefully when facing an urgent risk of unsafe water discharge from Lake Okeechobee. This is especially important when considering the high probability of widespread HAB formation in Florida's waterways. In view of the experience gained in this initiative, we propose the following process to cope with future emergency situations (Fig. 8, Flowchart). To significantly shorten the time between a HAB alert and mitigation activities that will be supervised by *DEP* and local agencies, *BlueGreen* will transfer a significant part of its manufacturing capability to Florida and maintain an emergency warehouse with sufficient amount of *Lake Guard®* Oxy (see below).

© BlueGreen Water Technologies Ltd

The following draft Emergency Response Plan (Fig. 8) is an example whereby a coordination between *DEP*, local Water Management Districts and *BlueGreen* can expedite the initiation, regulatory aspects, and treatment of HABs. With a local stockpile for the State of Florida, *BlueGreen* will be able to activate a mitigation project within hours from receiving approval from the relevant agencies (Fig. 8).

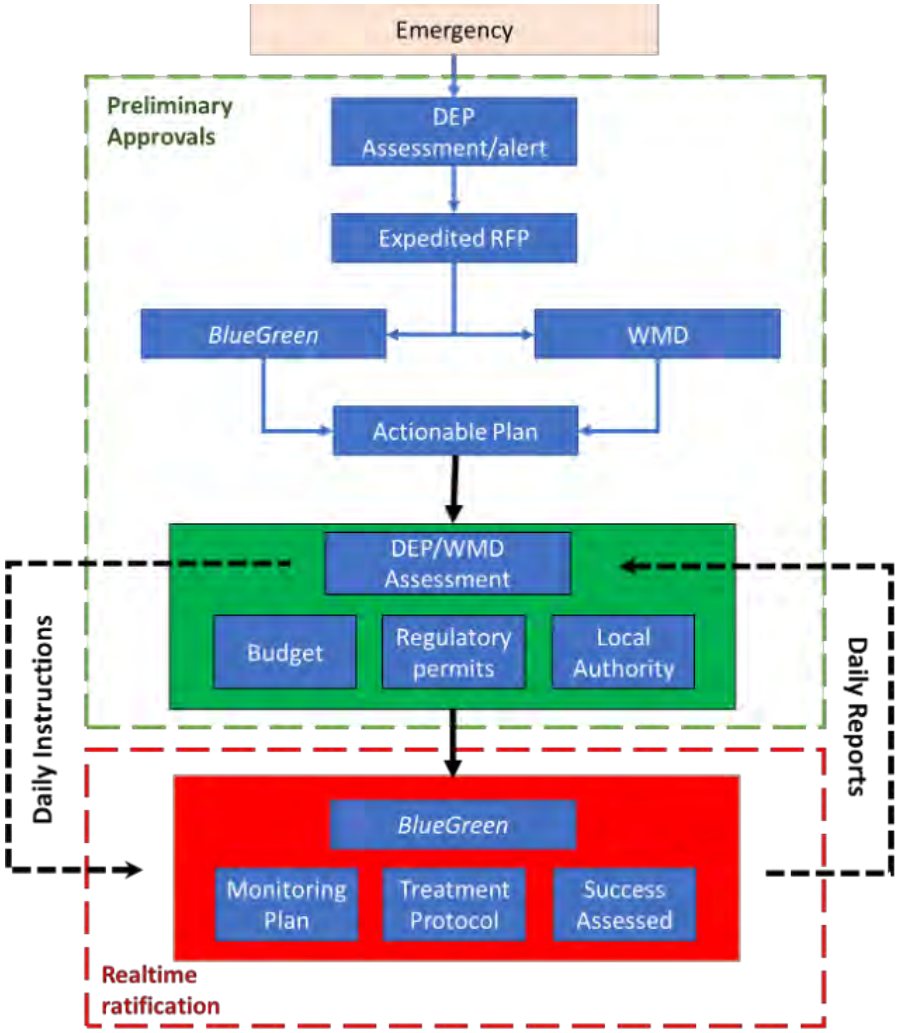

Fig. 8. Proposed flowchart of the critical path during an algal bloom emergency.
It is proposed to pre-approve the lion-share of the preliminary actions required during an emergency mitigation Initiative, thereby reducing the time-to-action to hours, allowing greater flexibility to local authorities to manage cases of algal blooms in their jurisdiction and prioritize other activities accordingly (e.g., drinking water, major sport events, etc.).
Abbreviations: DEP – Department of Environmental Protection; RFP – Request for proposals; WMD – Water Management District; BlueGreen – BlueGreen US Water Technologies Inc.

© BlueGreen Water Technologies Ltd

The following is *BlueGreen*'s proposal for future emergency deployments, based on an emergency stockpile that *BlueGreen* will build and maintain for the State of Florida. Considering the products' shelf-life of 1 year, we suggest an initial allocation of 20 tons of the *Lake Guard®* Oxy to be stored by the State of Florida. We would supply this at a discounted rate for near-future emergency deployments.

5.1.1. Emergency Mitigation Initiative (draft for discussion)

A. Stockpiling

- Maintaining, at all times, a **20-ton *Lake Guard®* Oxy stock (40,000 lb)**, or as may otherwise be agreed on, in a central location in the State of Florida ("Emergency Stock")
- *BlueGreen* shall finance the manufacturing underlying the Emergency Stock
- *DEP* will be charged with direct storage fees plus 10% overhead on a monthly basis
    - Current direct rate for storage is $30/pallet (each pallet holds 2,000 lb)

B. Response to Emergencies

- Throughout the term, *BlueGreen* shall be responsible to react to any emergency prompted by *DEP* in areas not larger than 2,000 acres[1] (per any single case) within 96 hours from the official notice
- *BlueGreen* shall charge *DEP* a fixed rate of $175,000 per every 250 acres (or a part thereof) for a single interventional treatment[2], designed to reduce the cyanobacterial bloom to below danger levels of 20,000 cyanobacterial cells/ml ("**Intervention Rate**");
- The Intervention Rate shall be discounted by 15% [3], regardless of what occurs first (i) Dec. 31, 2021; or (ii) the total reported use of the first 20 tons of *Lake Guard®* Oxy,.[3]

[1] Assuming the total Emergency Stock is of no more than 20 tons of *Lake Guard®* Oxy.
[2] Treatment application is strictly with *Lake Guard®* Oxy, NSF/ANSI/CAN-60 certified product.
[3] Factoring in unused product from the C-44 initiative and its 1-year shelf-life.

© BlueGreen Water Technologies Ltd

5.2. Drawing conclusions from the C-44 Canal Initiative: Minimizing the future risk of water discharges from Lake Okeechobee

BlueGreen's scientific team is hereby proposing a draft plan to control the cyanobacterial population during water discharges from the lake by means similar to those executed in the C-44 Canal, in accordance with canal-specific parameters. This draft plan is based on many discussions with *DEP* experts during the C-44 Initiative operation, analyses of the geochemistry and biological conditions in C-44 Canal, and in-depth analyses of earlier studies performed by other experts in Florida regarding the Lake Okeechobee's canal system.

BlueGreen's proposal includes the following items:

A. Setup an online cyanobacterial monitoring system along every major discharge intersection (few canals have existing monitoring equipment, set by the USGS);
B. Construct silos ready to accommodate the *Lake Guard®* Oxy in strategic locations along said canals (permanent or temporary), which can be controlled either manually or automatically through the above monitoring systems to trigger spot treatments in the event that the content of cyanobacterial cells in the discharged water exceed pre-approved levels.
    - The product particles will move with the advancing waters in the canal, interact with cyanobacterial aggregates as they move along with the current, and prevent the downstream spread of contamination
C. *BlueGreen* will monitor and analyze the Canal's waters and provide daily reports to the relevant state agencies.

© BlueGreen Water Technologies Ltd

Since each Water Management District has its own hydrologists, water quality experts, and stake holder forums, an integrated part of the preparation need to satisfy all legal aspects, and accommodate inter-agency requirements. So upon an emergency situation, a fast approval process can take place.

Once legal aspects, and inter- and intra-agency requirements are regulated, such an integrated warning and immediate response system will allow, for the first time, the *DEP*, local state agencies, and the U.S. Army Corps of Engineers, to discharge water from the lake under optimal technical and biological conditions. Water could be released in a timely fashion, year-round in small quantities, each time via a different canal so that any impact on downstream salinity and the overall effect on the ecological habitat will be minimized.

5.3. HAB mitigation in Lake Okeechobee

BlueGreen, with its technology, technical capabilities, and knowhow, can monitor and effectively treat lake systems like Lake Okeechobee. The technology will reduce and maintain safe levels of cyanobacteria in the aquatic ecosystem. The *Lake Guard®* Technology (Appendix A) targets cyanobacteria while enriching beneficial, non-harmful species in the water body. The beneficial green algae can, in turn, serve their biological role as natural competitors to cyanobacteria, and by doing so redistribute nutrients in the water.

This section highlights, in broad terms, the processes that are needed for a Campaign of such magnitude:

1. Setting up a central production facility of *Lake Guard®* Oxy in the State of Florida (that may also serve the entire East Coast of the U.S.)
2. Conducting a detailed survey of the Lake which will involve (including, but not limited to) artificial intelligence and near real time satellite imagery, mapping of the Lake's littoral zones and marshes

© BlueGreen Water Technologies Ltd

for cyanobacterial “batteries”, identifying pockets that serve as a source of cyanobacterial contaminations, detailing phytoplankton composition, analyzing the hydrodynamics that influence the distribution of algal blooms in the entire water body; studying the variation of season weather conditions and wind patterns; downloading and statistical analyzing all the accumulated data of Lake Okeechobee from decades of research, etc.

3. Timely aerial spot applications of the *Lake Guard®* Oxy in pre-defined ‘drop zones’ designed to surgically and selectively reduce cyanobacterial cell density in the water.

Additionally, we propose a proof-of-concept operation targeting a smaller body of water, such as Lake Apopka in 2021.

© BlueGreen Water Technologies Ltd

Appendix A. *Lake Guard®* Technology

The *Lake Guard®* technology, a targeted treatment against blue green algae, selectively eliminates and prevents toxic algal blooms in lakes irrespective of size and scale. It is a proprietary new formulation of potent algaecides that allows the granular product to float and time-release the active ingredient on the water surface, while homing-in on cyanobacterial aggregates as they drift in the water. The *Lake Guard®* technology triggers a biological programmed cell death within the general cyanobacterial populations that results in a population-wide collapse.

BlueGreen Water Technologies is commercializing its second generation *Lake Guard®* technology in *Israel*, the U.S., China, South Africa and Russia: The *Lake Guard®* Oxy.

The *Lake Guard®* Oxy is *comprised* of 98% (w/w) sodium percarbonate that releases hydrogen peroxide (H_2O_2) as its active ingredient, and 2% (w/w) inert, biodegradable encapsulating agent.

The *Lake Guard®* Oxy is approved by the U.S. EPA, certified by the NSF/ANSI/CAN-60 for treatment in drinking water, and registered with the Florida department of Agriculture and Consumer Services.

The ready-to-use *Lake Guard®* products can be broadcast manually from the shore, a boat, or a plane, in any water body no matter its size and shape. This technology is in stark contrast to existing methodologies that require large quantities, are hazardous and labor-intensive, and involve high-cost full-lake shock treatment. Unlike existing methodologies, the *Lake Guard®* technology is scalable to large water bodies, thousands to tens of thousands of acres in size.

BlueGreen recommends that the *Lake Guard®* products be used preventatively, during the early stages of an evolving cyanobacterial outbreak, therefore prescribing even lower doses of the active ingredient. Such early treatment eliminates cyanobacteria before the inevitable build-up of cyanotoxins during

© BlueGreen Water Technologies Ltd

bloom episodes. Thus, securing a safe cleanup of the toxic species without the risk of increasing toxin-levels in the water or reducing dissolved oxygen levels that are associated with the decomposition process of massive amounts of cyanobacterial dead cells.

© BlueGreen Water Technologies Ltd

Appendix B. Scientific Summary

In situ measurements

Methods:

The monitoring protocol included 3 pre-defined sampling points along the C-44 Canal. A 4th sampling point was added by *BlueGreen* scientists (the S-308 Lake Side) to improve the power of the analysis:

- S-308 structure Lake side, Latitude: 26.98488, Longitude: -80.62157 (Figs. 1 and 3);
- S-308 structure Canal-side, Latitude: 26.98524, Longitude: -80.62088 (Figs. 1 and 3);
- C-44 Canal, 12 miles downstream from the S-308 structure, Timer Powers Park, Latitude: 27.01818, Longitude: -80.44269 (Fig. 1)
- C-44 Canal, 21 miles downstream from the S-308 structure, the St. Lucie Lock and Dam- S-80, Latitude: 27.11017, Longitude: -80.2858 (Fig. 1)

Measurements were taken three times a day, morning (~07:30-9:00), noon (~12:00-13:00), and afternoon (~16:00-17:00). At a depth of 0.5 m below water surface. For each sampling point, we recorded 15-20 different measurements.

Monitoring parameters included:

- Field water measurements with a daily calibrated verified YSI ProDSS multiparameter:
    - Water temperature
    - Water conductivity
    - Dissolved oxygen (D.O.)
    - pH
    - Chlorophyll-b (Chl-b, proxy to the total biomass of green algae)
    - Phycocyanin (P.C., proxy to the total biomass of cyanobacteria)

© BlueGreen Water Technologies Ltd

- Field microscopy of water samples from all sampling points to detect the variety of cyanobacterial species present in water samples
- Visual inspection of cyanobacterial scum or cyanobacterial cell aggregates conducted no less than three times per day. Monitoring and response crews were stationed 24/7 next to the C-44 canal.

Final daily report from Nov. 04, 2020, that includes all data, is attached as **Appendix C**.

All YSI-ProDSS measurements are attached as **Appendix D**.

Results and Discussion:

Measurements were collected and recorded three times a day (Figs. S1-S6). Since, overall measurements did not change significantly during the day per each sampling site, we compared measurements among the sampling sites during the morning hours (Fig. 6). This comparison should reflect other measurements taken at noon and the afternoon hours as well. As expected from a large water body, water temperatures (Figs. 6 and S1) remained stable throughout the canal during the day. Water conductivity in the Canal, however, changed along the canal, and the overall salinity levels in the canal were reduced (Figs. 6 and S3). On Oct. 14, 2020, the conductivity levels at the S-308 Structure was 2-fold and 1.5-fold lower than in Timer Powers Park, and the S-80 Structure, respectively. This trend changed within 5-6 days after Lake Okeechobee waters were released to the Canal (Figs. 2, 6 and S3) and the conductivity levels at the S-80 structure dropped from around 600 µS/cm towards 400 µS/cm.

Cyanobacterial presence was extensively monitored by the *BlueGreen* team using *in-situ* measurements for phycocyanin levels (Figs. 6 and S6), as well as a daily microscopic evaluation of water samples. These readings were consistent with *DEP* and *SFWMD* measurements that were taken 2-4 times/week. Notably, cyanobacterial numbers did not exceed 10^3 cells/ml (detection level) in the S-308 structure and was below detection levels further downstream. The cyanobacterial numbers were higher at the S -308 structure and were directly influenced by the rate of water discharge from the lake (Figs. 6 and S5-6). Cyanobacterial presence declined substantially downstream within 1-2 miles from the S-308 Structure, probably due to inflow of water containing abundant organic material. This phenomenon was maintained along the Canal, where more water fed into the C-44 Canal, as was apparent by the lower pH (Figs. 6 and S4; from pH 7.8-8 at S-308 towards pH 7.4 downstream). Another factor that might have affected the cyanobacterial presence in the water body was the high salinity levels as described above.

Weather conditions including rain, temperature, and cloud coverage may have affected few of the filed measurements.

On October 30, 2020, the Phycocyanin levels increased at the S-308 structure, followed by a similar increase of Chlorophyll levels, and triggered *BlueGreen* team into heightened alert (Figs. 6 and S5-6). *BlueGreen* proposed a preventive treatment using 50 lb/hour of the *Lake Guard®* Oxy providing these numbers persist. But *DEP* decided to wait with the treatment application until cyanobacterial cell count approach 20,000 cells/ml, while closely monitoring the conditions in the waters.
