## ***Forward***

The Florida Legislature has declared the Department of Environmental Protection (Department or DEP) as the beach and shore preservation authority for the state and has directed the Department to develop and maintain a comprehensive long-term management plan for the restoration and maintenance of the state's critically eroded beaches fronting the Atlantic Ocean, Gulf of Mexico and the Straits of Florida, pursuant to Section 161.161, Florida Statutes (F.S.). The Department initially adopted the Strategic Beach Management Plan (SBMP) in October 2000 and updated it in May 2008, June 2015, and May 2018. The updates to the SBMP are prepared in accordance with Sections 161.091, 161.101, 161.142, 161.143 and 161.161, F.S., to reflect current beach and inlet conditions.

A public meeting was held on September 16, 2019, to receive comments on the proposed SBMP. Comments from the public were also received by the Department by e-mail after the public meeting. The public comments received were reviewed, and edits to the SBMP were made by Department staff that were deemed necessary.

The SBMP contains information and management strategies for coastal inlets. A new or updated inlet management plan (IMP) adopted by the Department shall supersede inlet management strategies for that inlet set forth in the SBMP. Likewise, the strategies set forth in the SBMP shall supersede strategies in any previously adopted IMP to the extent they may be in conflict. In short, the document with the latest date for the IMP strategies applies.

The SBMP is based upon the supporting data referenced in the SBMP or contained within files of the Department. Strategies in the SBMP are subject to ongoing evaluation and update as conditions change and information becomes available to the Department. The strategies identified in the SBMP shall be eligible for state financial participation subject to Department approval and appropriation from the Florida Legislature, pursuant to Section 161.091, F.S. The level of state funding shall be determined based upon the activity being conducted pursuant to Section 161.101, F.S. and Chapter 62B-36, Florida Administrative Code (F.A.C). The Department may choose not to participate financially if the proposed method for implementation is not cost effective or fails to meet the intent of Sections 161.101 and 161.161, F.S. Nothing in the SBMP precludes the evaluation of other alternative strategies which are consistent with Chapter 161, F.S.

## ***Introduction***

Beaches are dynamic landforms at the edge of the ocean or gulf subject to both natural and man-induced erosion. Sand moves along the shore due to breaking wave driven currents and tides, and storms can cause dramatic changes to the beach. Coastal erosion is caused in part by the creation and maintenance of inlets, where the sand has historically been removed from the coastal system by dredging, and the natural drift of sand along the shore is blocked by jetties, trapped in channels, or moved into ebb and flood shoals. The development and the placement of infrastructure near the shore can also contribute to coastal erosion by limiting the amount of sand stored in dunes and hardening the shore for protection of upland property. Changing sea levels can also contribute to long term coastal erosion along Florida's coastline. Coastal communities will need to plan for community resiliency in low-lying coastal zones to be prepared for coastal flooding, extreme high tides, sea level rise or storm surges. For additional information, see [Section 163.3177](#) and [Section 163.3178](#), F.S., regarding the Peril of Flood Act and the [Florida Resilient Coastlines Program](#).

Florida depends on its 825 miles of sandy beaches fronting the Atlantic Ocean, Gulf of Mexico and Straits of Florida as a natural resource for the enjoyment of its residents and tourists. Beaches are Florida's primary tourist attraction, generating millions of dollars annually for Florida's economy. The Economics of Florida's Beaches, Phase I - The Impact of Beach Restoration (2003) highlights the importance of beaches to Florida's ocean economy and the Economics of Florida's Beaches, Phase II - The Economics of Beach Tourism in Florida (2005). An additional study by the Florida legislature's Office of Economic and Demographic Research (EDR) found that pristine beaches are the most important feature of Florida's brand as a tourist attraction with tourism being Florida's leading industry. See [Economic Evaluation of Florida's Investment in Beaches \(2015\)](#). Nourished beaches contribute to the expanding federal, state and local tax bases; increase sales, income, and employment opportunities from resident and visitor spending; and enhance property values by protecting the developed shorefront from storm surges, prevent loss of upland property and protect wildlife habitat. Beaches provide habitat for many species, including endangered and threatened marine turtles, birds and mammals. Additional studies on the economics of beaches are referenced below.

Beach and inlet management activities and practices in the state of Florida are governed by the [Dennis L. Jones Beach and Shore Preservation Act](#), Chapter 161, F.S. In 1986, pursuant to Sections 161.101 and 161.161, F.S., the Department of Natural Resources, Division of Beaches and Shores (now the Department of Environmental Protection, Office of Resilience and Coastal Protection) is charged with

the responsibility to identify those beaches of the state which are critically eroding and to develop and maintain a comprehensive long-term management plan for their restoration. The Department's long-term management plan has several components including the Critically Eroded Beaches Report and the SBMP.

The SBMP identifies strategies at critically eroded beaches and inlets consistent with the goals set forth in Section 161.091, F.S., of the Beach and Shore Preservation Act:

- Maximize the infusion of beach-quality sand into the coastal system;
- Implement those projects that contribute most significantly to addressing the state's beach erosion problems;
- Promote inlet sand bypassing to replicate the natural flow of sand interrupted by improved, modified or altered inlets and ports;
- Extend the life of beach restoration projects and reduce the frequency of nourishment;
- Encourage regional approaches to ensure the geographic coordination and sequencing of projects; and
- Reduce equipment mobilization and demobilization costs.

“Critically eroded shoreline” is defined in subsection 62B-36.002(5), F.A.C., as, “a segment of the shoreline where natural processes or human activity have caused or contributed to erosion and recession of the beach or dune system to such a degree that upland development, recreational interests, wildlife habitat, or important cultural resources are threatened or lost. Critically eroded areas may also include peripheral segments or gaps between identified critically eroded areas which, although they may be stable or slightly erosional now, their inclusion is necessary for continuity of management of the coastal system or for the design integrity of adjacent beach management projects. The “[Critically Eroded Beaches in Florida](#)” report lists segments of shoreline that have been designated by the Department as critically eroded.

The SBMP addresses critical erosion and beach project areas in the context of subregions that are defined by the boundaries of distinct coastal littoral processes. The SBMP also provides a summary of previous projects to address beach erosion within each subregion. Feasibility studies and reports conducted by local governments, consultants, federal and state agencies are listed at the end of each subregion section in the SBMP.

There are several elements required for beach management activities to be eligible for state cost

sharing: proposed work must be consistent with Chapter 161, F.S., be within a critical erosion area designated by the state, be consistent with the strategies listed in the state adopted SBMP and/or IMPs, monitoring must be required by state or federal permit and the proposed work must have a Department approved scope of work. To be consistent with Chapter 161, F.S., beach quality bypass material must be placed on the beach to be considered eligible for cost sharing. State cost sharing is provided through legislative appropriations based on proposed activities listed in the annual local government funding request (LGFR), processed through the [Beach Management Funding Assistance Program](#). State cost share is subject to adjustment for the level of public accessibility that is calculated for beach management projects. Project cost sharing criteria is described further in the beach funding rule [62B-36.007, F.A.C.](#) Chapter 161, F.S. was amended in 2019 by the legislature to enhance the cost share criteria and cost sharing opportunities within the beach funding program. Rulemaking is underway to rule 62B-36, F.A.C. to implement the amended Sections of 161.101 and 161.143 F.S., to develop a revised beach and inlet ranking methodology. Additional information about beach management projects by county can be found at the [local government funding requests](#) webpage and also at the [long range budget plan](#) webpage. The SBMP is a dynamic management tool for use by private individuals and federal, local and state government officials. It is intended to be updated periodically as specific strategies are implemented, new resources and opportunities are identified, and proposed strategies are developed by the Department and federal or local government sponsors. The entire SBMP is available on the Department's [Office of Resilience and Coastal Protection](#) website with a list of acronyms within the plan. Additional information on Florida's [public beaches or coastal access guide](#) can be found on the Department's web page or in [Map Direct](#).

## ***Organization of the Strategic Beach Management Plan***

The SBMP describes beach and inlet management strategies for seven coastal regions and 32 subregions, as shown in Figure 1. For each region and subregion, the SBMP contains the following:

- A description of inlets, storms and critically eroded shoreline, as well as beach/inlet projects are provided. For ease of reference, the SBMP describes critically eroded shoreline segments using Department [range or reference \(R\) monuments](#) in the title. Where sandy beaches are located, the Department has positioned R monuments approximately every 1000 ft along the state's shoreline for the purpose of measuring beach erosion and beach accretion. Inlets (also commonly referred to as "passes") are labeled with adjacent R monuments and the name of the

county.

- A description of the geographical area; the proposed or constructed projects, a project history table and the specific project boundary is also provided.
- Sand placement volumes listed in the project paragraph or project tables use the “placement volume” instead of the pay volume.
- Strategies that the state recommends for management of the critically eroded shoreline, to mitigate critical erosion and the activities that would be considered eligible are listed for state cost sharing under Sections 161.101 and 161.161, F.S.
- A summary of each subregion strategies for beach and inlet management, including sponsors, funding, project coordination, environmental protection, sand sources and additional information can be found in the introduction and subregion maps.

IMPs adopted by the Department after the adoption of the SBMP supersede the strategies identified in the SBMP. Likewise, the strategies set forth in the SBMP supersede strategies in any previously adopted IMP to the extent they may be in conflict. The Department is currently reviewing the [American Shore and Beach Preservation Association](#) (ASBPA)’s - [beach nourishment database](#) to make sure there is consistency between the Department’s project data and ASBPA’s project data.

## ***Permitting***

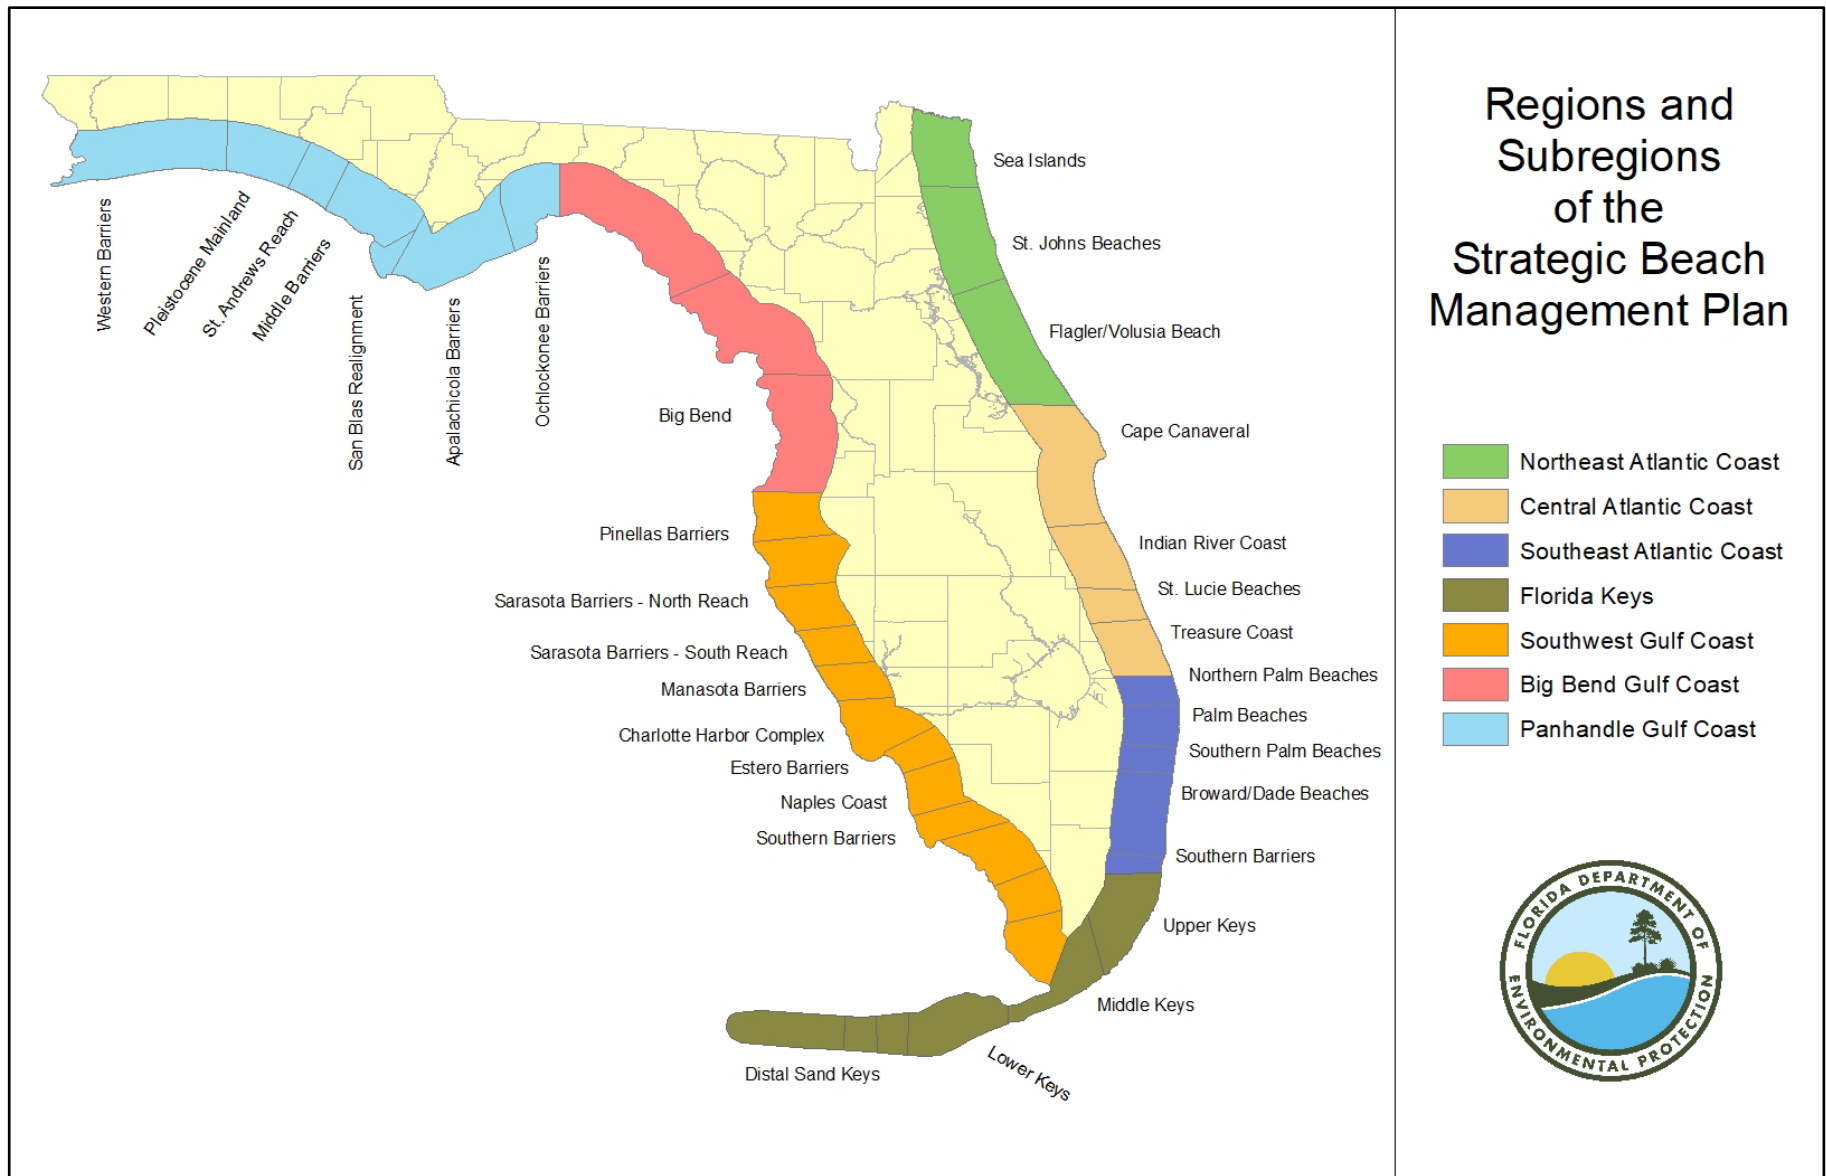

All projects proposed to implement the strategies identified in the SBMP must obtain the appropriate federal and state permit authorizations. Applicants must demonstrate the project will comply with Florida’s water quality standards and must protect threatened and endangered species as required in [Biological Opinions](#) issued by the [U.S. Fish and Wildlife Service](#) and [NOAA’s National Marine Fisheries](#). Projects must also comply with the authorities of the [Florida Fish and Wildlife Conservation Commission \(FWC\)](#), the Florida Department of State’s [Division of Historical Resources](#), and other state agencies as incorporated in the [Florida Coastal Management Program](#) within the [Office of Resilience and Coastal Protection](#).

All beach management or inlet projects must obtain a joint coastal permit (JCP) through the Department’s [Beaches, Inlets & Ports Program](#). Each project that obtains or is pursuing a permit can be viewed at the [Permits by County](#) webpage. JCP permitting considerations typically include an

assessment of the compatibility of sand proposed to be utilized with the existing beach; project dimensions that may adversely affect nearshore hardbottom, or allow additional lighting on the beach that could affect marine turtle nesting and hatchlings; turbidity levels at the borrow site and placement site; use of structures to control erosion within one segment of beach but potentially cause erosion on another segment; and seasonal windows of construction and construction management to protect marine turtles, manatees, Gulf sturgeon and nesting and migrating shorebirds and other imperiled species (see, for example, Section 161.163, F.S. and Chapter 62B-41, F.A.C.). Projects in or near [Aquatic Preserves](#) and other Outstanding Florida Waters (OFW) must comply with more stringent state water quality standards, pursuant to [Sections 258.39 and 373.414, F.S.](#) In addition, beach and inlet projects must comply with applicable requirements relating to sovereign submerged state land and coastal construction found in [Chapter 253, F.S.](#) and [Section 161.053, F.S.](#)

The Department's [Coastal Construction Control Line \(CCCL\) Permitting Program](#) is an area of jurisdiction in which specific siting and design criteria are applied for upland construction to minimize adverse impact to the beach and dune system. Condominiums, hotels, homes, pools and boardwalks, etc. that are constructed seaward of the CCCL must meet the specific requirements of this program. Also, dune restoration projects landward of the mean high water may be permitted through the CCCL program. The CCCL location is based upon appropriate engineering predictive models and scientific principles to determine the upland limits of the effect of a one-hundred-year coastal storm event.

A more precise definition of a one-hundred-year storm event is that the storm surge of a major storm has a one percent probability of occurring at a specific location in any given year. Encountering a one-hundred-year storm event for one year does nothing to change the probability of receiving another one-hundred-year storm event the next year or the following year. The CCCL is located along most coastal counties of Florida and where there is not a CCCL, there is a fifty-foot set back line. The fifty-foot set back line is measured from the mean high water line and creates a jurisdiction of siting and design criteria that are regulated by the CCCL program in the following counties: Wakulla, Taylor, Dixie, Levy, Citrus, Hernando, Pasco and Monroe.

**Figure 1.** Map of the statewide SBMP's regions and subregions. View an [interactive map](#).

## ***Monitoring Programs***

The Department conducts [regional coastal monitoring](#) to collect and process beach profile survey data and aerial photography. Physical monitoring is used to assess and manage beach erosion control projects and inlet sand bypassing projects, to track shoreline position and volumetric changes to document performance of project nourishment and to validate the sediment budget for littoral sand transport through a specific coastal zone area. Permit-required monitoring of beach and inlet management projects is incorporated into regional monitoring activities to avoid duplication. Physical and environmental monitoring programs are being conducted for ongoing and recently completed projects. The Department may share in the cost of physical and environmental monitoring programs that are required by state and federal permits, pursuant to Sections 161.101 and 161.161, F.S., when state appropriations are provided.

Physical monitoring consists of the collection and analysis of topographic and bathymetric surveys of the beach and dune system, inlet channels and shoals, and the nearshore and offshore zones to the depth of active littoral sand transport in the area. The Department has also developed technical specifications for [Monitoring Standards for Beach Erosion Control Projects](#). Profile surveys at R monuments have been used since the early 1970s to measure beach erosion and to develop a [historic shoreline database](#) to assist with managing Florida's sandy coastal zone. Physical monitoring also consists of the review of aerial photography found on the Department's [interactive maps](#) and also a digital collection of aerial photographs and shoreline trends ([COASTS](#)).

Environmental or biological monitoring consists of the collection and analysis of nesting and hatching data for marine turtles and shorebirds; density and diversity of epibiotic species on nearshore hardbottom and artificial reefs; submerged aquatic vegetation and some fish surveys. Environmental monitoring is used to assess the effects of beach erosion control projects and the success of artificial reefs that are required for mitigation for some beach nourishment project impacts. The Department, through the [Beaches, Inlets and Ports Program](#), has issued guidance for nearshore hardbottom assessment and monitoring protocols for the subregions that have hardbottom. For additional information, see the [Standard Operation Procedures for Nearshore Hardbottom Monitoring of Beach Nourishment Projects](#).

## ***Emergency Response***

If the Governor declares a shore erosion emergency, the Department may provide funding or take action to alleviate shore erosion, pursuant to Section 161.111, F.S. Federal public assistance may also be available to fund emergency response work and storm damage recovery. The Department recommends that local sponsors develop emergency response plans for post-storm recovery and emergency beach maintenance. These plans should include a damage assessment methodology, preliminary plans and contract documents, applications for emergency permits, sources of sand and identification of a local funding sources. The Department also recommends that communities maintain records of their ongoing programs to monitor beach erosion and maintain their beach and dune systems (Figure 2). Such documentation may help demonstrate the need for federal public assistance for beach or dune restoration projects after a disaster event.

**Figure 2.** Mexico Beach with a newly constructed FEMA dune/berm in 2019, post-Hurricane Michael (2018). The FEMA dune/ berm is located between the inlet (R128) and the Bay/ Gulf County line (R144). Department file photo taken in October 2019 by W.G. Weeks.

Following Hurricane Opal in 1995 and the 2004/2005 hurricane seasons, the Department created [Recovery Plans](#) that focused on projects to be constructed to provide immediate protection. After the 2004 hurricane season, the Florida legislature allocated \$68 million in funding to implement these recovery plans, plus \$30 million in annual allocation for beach management projects. An additional \$116 million of federal funds through the U.S. Army Corps of Engineers (USACE) was allocated by Congress to restore or nourish the federally authorized shore protection projects. The recovery plans identified projects which would provide a reasonable level of protection to the upland along the areas impacted and were meant to be coordinated by all levels of government in the most efficient manner possible. The Department also creates [Post-Storm Reports](#) after tropical storms or hurricanes impact the state's shoreline, such as with Hurricane Michael in 2018 as shown in Figure 3. For additional information on tropical storms and hurricanes, visit the National Hurricane Center's [storm data archives](#).

The State of Florida was significantly impacted by four hurricanes, Hermine, Matthew, Irma and Michael, during the 2016, 2017 and 2018 hurricane seasons. To see additional information for strategies and funding to address recovery for the beaches and dunes, see the “[Hurricane Damage Assessment Report for 2016: Florida's Beaches and Dunes](#).” For the 2017 Hurricane season, see the “[Hurricane Irma Post-Storm Beach Conditions and Coastal Impact in Florida](#)” report. To see additional information on strategies and funding to address recovery for the beaches and dunes due to Hurricane Michael in 2018, see the “[Hurricane Michael Post-Storm Report](#)” and “[Hurricane Michael Recovery Plan](#).” For all other material on [hurricane information](#), see the Department's web page.

**Figure 3.** NASA/ NOAA image of Hurricane Michael on October 10<sup>th</sup>, 2018, as it moved towards Florida's Panhandle coast. Image: NASA Earth Observatory images by Joshua Stevens, using data from NOAA's Geostationary Operational Environmental Satellite, GOES-16.

## Florida Inlets

There are 66 coastal barrier inlets in Florida, with 21 inlets along the Atlantic coast and 45 inlets along the Gulf coast, as shown in Table 1, Table 2, Table 3, Table 4 and Figure 4. [IMP's](#) adopted by the Department are incorporated into the SBMP by reference along with other inlet management strategies. Florida's IMP strategies are governed by Sections 161.142 and 161.143, F.S., with the intent of balancing the inlet's sediment budget and replicating the natural flow of sand (Figure 5). All elements of inlet management studies conducted for local governments by consultants are reviewed by the Department before being adopted into a IMP. The Department has adopted 20 IMPs. While certain inlets have IMPs adopted by the Department, other inlets may have special inlet management strategies in the SBMP that were derived outside of a formal inlet management study. Inlet bypassing projects take sand from one side of the inlet, or from within the inlet or its shoals, and places the material along the shorelines adjacent to the inlet to mitigate the erosive effects of the inlet.

### ***Project Management Overview***

As of October 2019, approximately 420 miles of sandy beaches and 8.7 miles of inlet shoreline are designated critically eroded, a condition where previous or continuing erosion threatens private or public development and infrastructure, or significant cultural or environmental resources (Table 5), pursuant to Sections 161.101 and 161.161, F.S. Managed miles (Figure 6) is defined by the Department as, **“beach restoration and beach nourishment, or inlet sand bypassing (collectively, “active management”) are being conducted along 231.3 miles of sandy beaches in Florida.”** A listing of the critically eroded beaches that are under active management is provided in Table 6, with a total of 89 listed projects.

When describing beach construction projects throughout the SBMP, the initial beach project adding sand to the beach is described as a “beach restoration” project. Any project that adds sand to the beach after the beach restoration is described as a “beach nourishment” project. Federally authorized shore protection projects are authorized by the U.S. Congress for federal funding assistance for up to a 50-year time period and the projects may be reauthorized at the end of the 50-year time period, if deemed

necessary.

**Table 5.** Miles of critically eroded beaches under active management by region.

<b>Region</b>	<b>Critically Eroded Beaches (Miles)</b>	<b>Critically Eroded Beaches that are Actively Managed (Miles)</b>	<b>Percentage of Critically Eroded Beaches that are Actively Managed</b>

## ***Assessment of Sand Sources***

The Department's [Regional Offshore Sand Source Inventory \(ROSSI\)](#) is a publicly available computer application that stores data regarding the location, nature and volume of marine sand sources for beach nourishment activities. ROSSI is used by coastal engineers, managers, and researchers for identifying supplies of beach-compatible sand in the planning, construction and maintenance of beach nourishment activities.

The federal Bureau of Ocean Energy Management's (BOEM) Minerals Management Program (MMP) is responsible for the management of offshore sand resources located outside of state waters and within federal waters on the Outer Continental Shelf. The MMP has initiated regional management strategies, where feasible, to manage the growing need for these sand sources. Projects in Brevard County, Collier County, Dade County, Duval County, Manatee County and Sarasota County have obtained sand through the MMP leasing program.

The Department and the USACE evaluated the demand for sand in five southeast Florida counties (St. Lucie, Martin, Palm Beach, Broward, and Miami-Dade) and the potential sand supplies in regional offshore locations (state and federal waters). The study concluded the regional offshore sand supply is more than adequate to meet the needs of all the beach nourishment projects in the five southeastern coastal counties through 2062. (Ousley et al., 2014).

The Department has outlined various regional sediment management (RSM) strategies in its IMPs and the SBMP. The USACE, Jacksonville and Mobile District RSM work aids the Department in updating these plans. It is the goal of the Department to coordinate with the USACE and implement strategies mutually beneficial to USACE and the Department missions by leveraging federal authorities, permits and funding.

## ***Offshore Sand Sources and Upland Sand Sources***

Historically, large volume beach nourishments have used sand from offshore sources and smaller volume beach nourishments or post-storm recovery activities have used sand from upland sand mines. Offshore sand is transported using ocean-going dredge vessels and upland sand is transported using large trucks (“truck hauls”). The high cost of mobilization of a dredge vessel is spread over the larger volume of transported material, which typically reduces the unit cost per cubic yard of sand for this construction method. While the unit cost per cubic yard of sand placed on the beach tends to be higher for truck hauls from an upland sand mine, there are some cost-saving benefits of truck hauls that help reduce overall, long term cost of project maintenance. Whether used for post-storm recovery or for placement in “hotspots” where accelerated beach erosion is occurring within a small section of the larger project area, truck hauls of upland sand can extend the time interval between major beach nourishments using offshore sand. Recently, beach nourishment using upland sand has been selected for maintenance of projects by the Town of Longboat Key and by Collier County. In these cases, smaller volumes of sand incrementally placed within segments of the project area are sufficient to maintain the project and avoid the high cost of mobilization of an ocean-going dredge vessel.

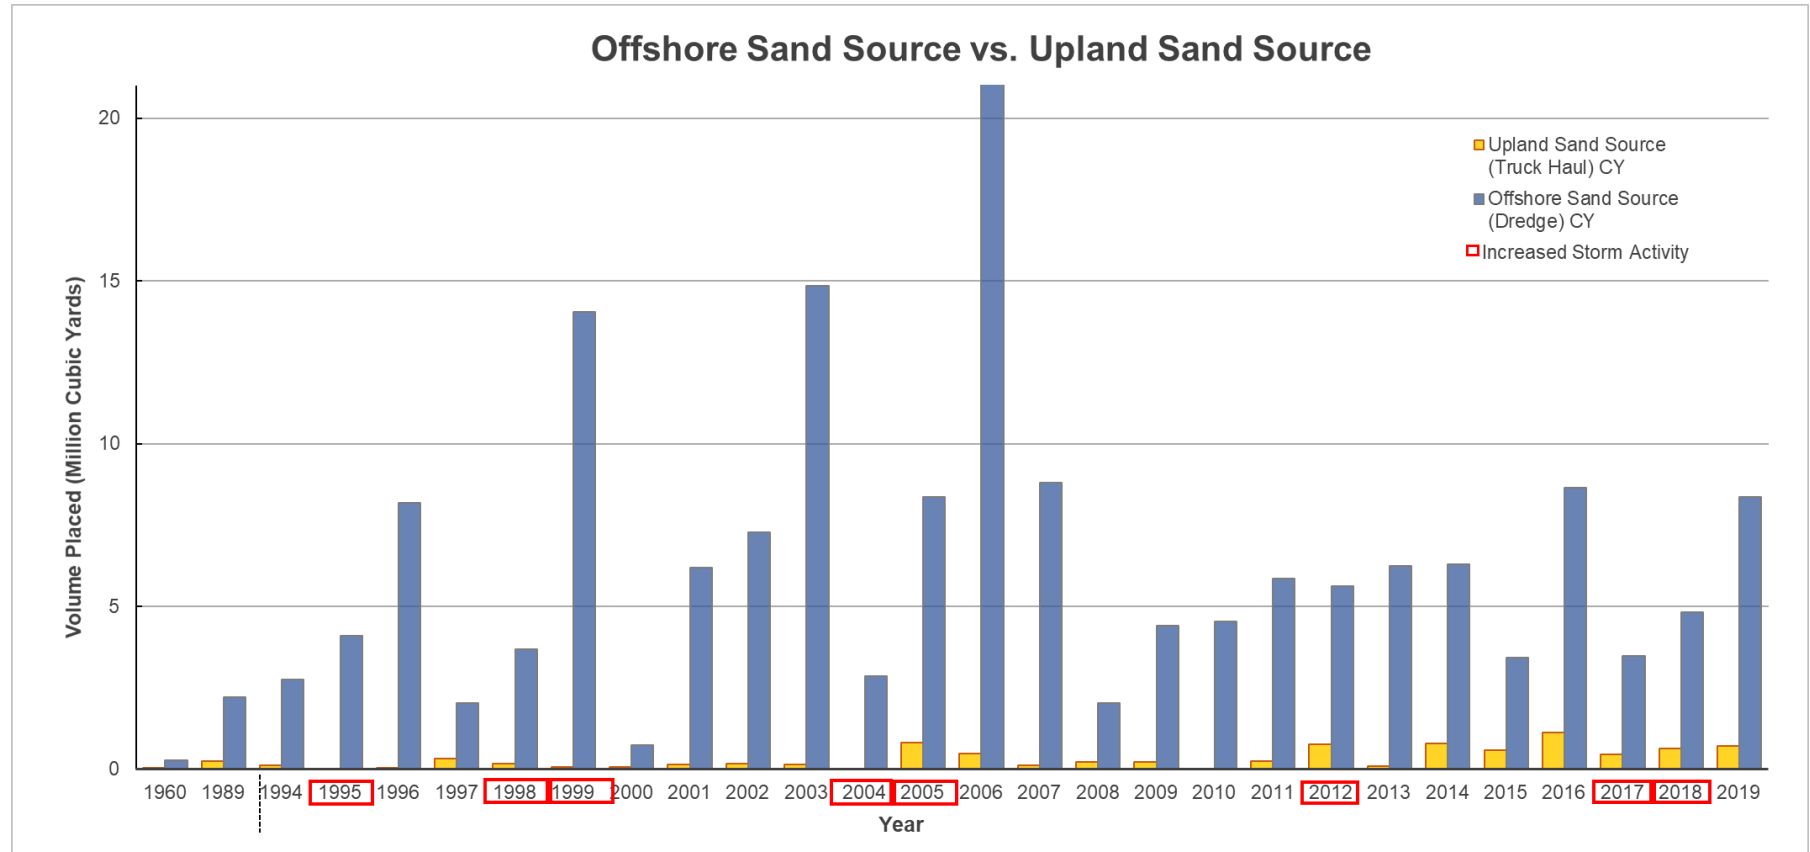

The volumetric differences between the two types of mechanical equipment used to transport sand sources to beach and dune nourishment projects are described in Table 7. Truck hauls, as shown in Figure 7, account for approximately 5% of the total beach nourishment activities from the listed projects below in Table 7. Offshore dredging projects, as shown in Figure 8, account for approximately 95% of total beach nourishment activities for the listed projects below in Table 7. A comparison of the volumes of sand from upland sources and offshore sources (including inlet channel dredging, inlet bypassing and offshore dredging) for beach projects during the period 1960 through 2019 is shown in Figure 9. The list excludes projects that used sand from both offshore dredging and upland sources and excludes years that had only projects using offshore sand. It should be noted that most of the upland truck haul projects are associated with dune restoration and nourishment projects conducted by local governments that are described further in Figure 9, Table 7, and within the subregions of the Strategic Beach Management Plan.

**Figure 7.** Wabasso Beach (Indian River County) nourishment project (Sector 3) using sand from upland sources. DEP project file photo (2010).

**Figure 8.** South Boca Raton beach nourishment project (2013) using sand from offshore sources. Photo courtesy of Peter Seidle, P.E.

**Figure 9.** The bar graph is comparing the volumes of offshore sand (dredged) to upland sand (truck hauled) used in beach nourishment or dune restoration projects (excluding placement of sand in nearshore areas) between 1960 through 2019. Red boxes highlighting years 1995, 1998, 1999, 2004, 2005, 2012, 2016, 2017, and 2018 indicate heightened storm activity. There were only two years prior to 1995 (1960 and 1989) with actual upland sand mine (truck haul) activities to compare to the offshore (dredge) activities. Data from year 2019 is based on the data submitted to the Department at the time of this report and 2020 data is still being processed. **Note:** the volumes shown below reflect only the volume numbers described in the SBMPs regions (2020 edition) and the offshore numbers reflect any sandy material that was dredged below the mean high-water line (inlet or offshore).

**Table 7.** Summary of upland sand source (truck haul) and offshore sand source (dredge) volumes by project location.

<b>Year</b>	<b>Upland Volume (CY)</b>	<b>Upland Sand Source (Truck Haul) Project Location (Local Sponsor)</b>	<b>Offshore Volume (CY)</b>	<b>Offshore Sand Source Project Location (County)</b>
<b>1960</b>	30,000	Smathers Beach (30,000) City of Key West	266,000	Dade

### ***Innovative Technologies***

The Department is directed to periodically review innovative technologies for beach erosion control and, on a limited basis, authorize, through the permitting process, experimental projects that are alternatives to traditional projects to determine the most effective and less costly techniques. The Department is authorized to co-sponsor demonstration projects of new or innovative technologies which have the potential to reduce project costs, conserve beach quality sand, extend the life of beach nourishment projects, and improve inlet sand bypassing. In ranking annual funding priorities of the beach erosion control program, the Department considers the use of innovative, cost-effective, and environmentally sensitive applications to reduce erosion.

An innovative technology workshop was conducted by the Department in February of 2006. The Department explained the applicable rules and statutes and presented the procedures for obtaining regulatory approval to those who presented their technologies. During 2006 and 2007, the Department formed an independent committee of coastal engineers and scientists to review and select innovative projects to be funded through a specific legislative appropriation in FY2006-2007. Based upon an evaluation of the proposed projects, funds were used for the design, permitting, construction, and monitoring of demonstration projects. The projects selected for funding were determined by the committee to have the potential to be economically viable when compared to conventional technology and expected to optimize the management of sediment, or some other erosion control system and project performance. Projects for examining the use of new approaches for beach management techniques are listed in Table 8.

**Table 8.** Beach erosion control projects utilizing innovative technologies (1980s through 2008).

<b>Project Name</b>	<b>Project Location</b>	<b>Date</b>	<b>Status</b>
Artificial Seaweed	Collier County, Manatee County, and Palm Beach County	Early 1980s	Ineffective and non-functional.
Beach Builder Screws	Flagler County	1985	Ineffective in moving sand and discontinued.
Beach Dewatering	Flagler County	1988	Results of the installation were inconclusive.
Undercurrent Stabilizers	Collier County	1984	No substantial beneficial effect on sediment accretion rates.

<b>Project Name</b>	<b>Project Location</b>	<b>Date</b>	<b>Status</b>
Prefabricated Erosion Prevention Reef (PEP) I	Town of Palm Beach	1987	Project had little, if any beneficial effect on the beach landward of the structure and was ordered removed.
PEP II	Town of Palm Beach	1991	Project determined to be causing erosion.
Biodune	St. Johns County and Brevard County	1986 and 1988	The Biodune synthetic gel composite did not affect coastal processes. Vegetation had difficulty establishing in the dune. Breaches in the dune toe rendered the product ineffective.
Aragonite Nourishment Project	Fisher Island, Dade County	1990	Overall shoreline location and beach profile remained stable.
Longard Tubes	Sand Key, Pinellas County	1992	Project performed (R60) well to stabilize the beach as temporary groins until construction of large-scale beach restoration project.
PEP Reef	Indian River County	1996	Results of the installation inconclusive.
Net groin study	Naples, Collier County	2000	Results of the installation inconclusive.
Net groin study	Okaloosa County (Eglin Air Force Base)	2001	A third-party peer review of the results of this test project indicated that this system did not meet the performance expectations and was not cost effective.
Porous groin study	Inlet Beach, Walton	2004	Results of the installation inconclusive.
Submerged geotube	Stump Pass, Charlotte County	2005	Resulted in shoreline retreat and was ordered removed.
<a href="#">Recycled glass sand demonstration project</a>	Broward County	2006	Test plots were installed on the upper beach in the summer. The next phase of testing in the surf zone was indefinitely postponed by county. <a href="#">2005 Study Report.</a>
Pressurized Equalizing Modules (PEMS)	Town of Hillsboro Beach, Broward County	2008	PEMS installed in March of 2008 and removed in 2011 as a NTP item for Hillsboro/Deerfield Nourishment. A third-party peer review of the results of this test project indicated that this system did not meet the performance expectations.

Project Name	Project Location	Date	Status
Multi-Purpose Artificial Surfing Reef	<a href="#">Brevard County</a>	2008	Feasibility Study to assess construction of a multipurpose artificial surfing reefs (ASRs), which may be compatible with Brevard’s shore protection project program. The document summarizes the ASR feasibility to assess potential locations for various types of multi-purpose artificial surfing reef. The project has not been constructed and was not considered to be economically justified by the county.

## Conclusion

The SBMP summarizes strategies the State of Florida uses to manage the coastline in critically eroded beach segments. The plan also describes the historical and present beach nourishment activities taken to restore and manage Florida’s beaches to protect upland property, restore habitat for wildlife and provide recreational opportunities for citizens, tourists and future generations. Additional information concerning projects or strategies along Florida’s coastline is available at the following links:

[Northeast Atlantic Coast Region](#)

[Central Atlantic Coast Region](#)

[Southeast Atlantic Coast Region](#)

[Florida Keys Region](#)

[Southwest Gulf Coast Region](#)

[Big Bend Gulf Coast Region](#)

[Panhandle Gulf Coast Region](#)

For additional information pertaining to beach and ocean conditions, coastal associations, educational institutions or government agencies, see the following [related coastal sites](#).

## ***Appendix - Acronyms***

### **Acronyms associated with the Florida Department of Environmental Protection’s Strategic Beach Management Plan:**

#### **Coastal Associations Acronyms:**

- ASBPA – American Shore & Beach Preservation Association
- FSBPA – Florida Shore & Beach Preservation Association
- DCA – Dredging Contractors of America

#### **Federal Agencies Acronyms:**

- BOEM – Bureau of Ocean Energy Management
- CBRA – Coastal Barrier Resources Act
- CHL – Coastal and Hydraulics Laboratory
- CIRP – Coastal Inlets Research Program
- CMS – Coastal Modeling System
- CSRM – Coastal Storm Risk Management
- CZMA – Coastal Zone Management Act
- EA – Environmental Assessment
- EIS – Environmental Impact Statement
- ERDC - Engineer Research and Development Center
- FCCE – Flood Control and Coastal Emergency
- FEMA – Federal Emergency Management Agency
- FRF – Field Research Facility
- GRR – General Reevaluation Report
- HSDR – Hurricane and Storm Damage Reduction
- LPP – Locally Preferred Plan
- LRR – Limited Reevaluation Report
- MMP – Marine Minerals Program
- NGVD 29 – National Geodetic Vertical Datum of 1929
- NAVD 88 – National American Vertical Datum of 1988
- NPS – National Park Service
- NWF – National Wildlife Refuge

- NEPA – National Environmental Policy Act
- NOAA – National Oceanic and Atmospheric Administration
- NHC – National Hurricane Center
- NWF – National Wildlife Refuge
- ODMDS - Ocean Dredge Material Disposal Site
- OCS – Outer Continental Shelf
- RSM – Regional Sediment Management
- SAJ – South Atlantic District, Jacksonville
- SPP – Shore Protection Project
- SLC – Sea Level Change
- SLR – Sea Level Rise
- TSP – Tentatively Selected Plan
- USACE – United States Army Corps of Engineers
- USFWS – United States Fish and Wildlife Service
- WRDA – Water Resources Development Act

**State Agencies Acronyms:**

- AIWW - Atlantic Intracoastal Waterway
- BCS – Beaches and Coastal Systems
- BIPP – Beaches, Inlets and Ports Program
- BMA – Beach Management Agreement
- BMFA – Beaches and Mines Funding Assistance Program
- BMP – Best Management Practices
- BSM – Bureau of Survey and Mapping
- CCCL – Coastal Construction Control Line
- COASTS – Collection of Aerials and Shoreline Trends Systems
- DEP – Department of Environmental Protection
- DMMA – Dredge Material Management Area
- DSL – Division of State Lands
- DWRM – Division of Water Resource Management
- ECL – Erosion Control Line
- EOC – Emergency Operation Center

- FAC – Florida Administrative Code
- FAR – Florida Administrative Register
- FDEM – Florida Department of Emergency Management
- FDFS – Florida Department of Financial Services
- FDOT – Florida Department of Transportation
- FHCF - Florida Hurricane Catastrophe Fund
- FIND – Florida Inland Navigation District
- FPS – Florida Park Service
- FS – Florida Statutes
- FWC – Florida Wildlife Commission
- IMP – Inlet Management Plan
- IWW – Intracoastal Waterway
- JCP – Joint Coastal Permit
- LABINS – Land Boundary Information System
- LGFR – Local Government Funding Request
- LRBP – Long Range Budget Plans
- MHWL – Mean High Water Line
- MLLW – Mean Lower Low Water
- MLW – Mean Low Water
- MOA – Memorandum of Agreements
- MOU – Memorandum of Understandings
- OCULUS – DEP’s Electronic Document Management System
- OGC – Office of General Counsel
- R – Range or Reference Monument/Survey Marker
- RCP – Resilience and Coastal Protection
- ROSSI – Regional Offshore Sand Source Inventory
- SAND – Sediment Assessment and Needs Determination Study
- SBMP – Strategic Beach Management Plan
- SOP – Standard Operating Procedures
- SOW – Scope of Work
- TAC – Technical Advisory Committee
- TIITF – Trustees of the Internal Improvement Trust Fund
- WCIND – West Coast Inland Navigation District
